Un-Cloud Your Passwords.
No servers. No snoops. Just you and your keys.

The Problem
You reuse passwords. Don't lie.

We all face significant challenges in managing **secure, unique passwords** across multiple devices.

Remembering and typing long, complex passwords is frustrating and time-consuming.

Plus, let's be real...Storing passwords online increases the risk of hacking, raising concerns about data security and user trust.

While password managers aim to simplify this process, they offer limited help unless the user is already logged in.

Your passwords are currently "*safe*" in the cloud.
Think that's secure? Ask the 33 million *LastPass* users who got burned.🔥

OUR MANIFESTO 🔒 OUR MANIFESTO 🔒 OUR MANIFESTO 🔒 OUR MANIFESTO

Trust math, not companies.

Local-first encryption (AES - 256)	———	Keys never leave your device.
Peer-to-peer sync over LAN	———	0 servers, 0 metadata.
Open source & reproductible builds	———	Inspect, verify, fork.
No telemetry by default	———	Privacy is the product, not a setting.

About Pluto

A simple plug-and-play device that **securely stores your passwords** offline and types them for you — all you need is your fingerprint to **unlock access.**

Encrypt locally	Master secret sealed with hardware-backed keys (Secure Enclave/TPM)
Fingerprint Authentication	No more passwords to remember, just tap with a finger.
Dead-Man Switch Recovery	Printable recovery kit using Shamir secret-sharing; no cloud escrow.

Pluto keeps your *data* so well, even *we* **don't have it**.
